

Blushield Tesla Large Area Model

Instructions for use

Plug the power pack into an existing socket in a central part of the area to be protected, if there is a switch at the wall socket. Make sure this is switched on. Take the small end plug and insert it into the socket on the case, do not exert too much pressure on the plug just so it is a firm fit. It may not appear to be all the way into the socket, this is acceptable. You will see the LED light up and flash intermittently every half minute or so through a small 1mm hole above the socket. This model has the new multi-wave waveform producing a symphony of frequencies to combat EMF at a cell level, rendering this model the best protection Blushield has released to date. The area to be protected is 90 meters radius from the point of plug-in. This model is ideal for large area protection in a warehouse or large office. Ideal for 5G.

As long as the Blushield Plug-in is left plugged in it will affect all people within the field range. A gauss meter will not indicate the actual neutralisation of the electrical fields as the Blushield works at a biological level, internal to the cell. The Blushield, will penetrate normal floors and walls (Gibraltar board or wooden). A normal size house would only require one unit. In multi storied office buildings more than one per floor maybe required depending on area to be covered. When deciding on a position, remember that it is designed to affect people not equipment, so place in a central area. The Blushield is safe to use with computers and will not erase data as the Blushield is non-magnetic. The Blushield does not emit any electromagnetic fields so does not generate interference which might affect sensitive equipment, including pacemakers. Blushield complies with EMC emission standards EN 50082-1:1992 and EN 50081-1. Blushield meets electrical safety standard NZ/AS 3100.

Make sure that this model is not plugged in near your bedroom, allow at least 4 meters space between the unit and your room as some people find it difficult to sleep when this is too close. Some people report that within the initial first few days after installing the Blushield they feel low in energy or tired. This detox is a transient condition and will pass within a few days. This is just the body adjusting to a new environment. Stick with it. Older people or persons who have poor health may take longer to adjust, in some cases up to 4-6 weeks. The detox is beneficial despite some people may feel uncomfortable. The Blushield is not an ionizer.

Blushield does not remove EMF nor does it modify EMF, using an EMF meter will not indicate any change in the environment. Blood tests were used to determine the Blushield's effectiveness.

How do I know it's working?

Once the Blushield is plugged in an LED will light every half minute or so. If this does not light up, then check the power switch. Make sure that the unit is plugged in correctly. Use a dedicated plug point try to avoid plugging into a power board with multiple plug outlets. This is not a therapeutic device and must not be sold as one. Any health benefits derived from the use of this device are purely consequential and no medical claims are stressed or implied. The Blushield Tesla Large Area Plug-in is guaranteed against faulty parts or workmanship for a 1-year period from date of purchase. This does not cover wear and tear, neglect or misuse of the product. Warranty does not cover lightning strike or power surge, the Blushield Tesla Large area model may need to be repaired after a power surge, in which case the customer has to pay any and all costs relating to the repair or replacement of the product.
